

New Kinds of Minds

A Global Atlas of Neurodiversity

Phase I: Mapping Latin American Neurodiversity. A dossier of the atlas as it exists in September 2026 and of the year proposed: its visual system, its data architecture, its participatory workflow, and its roadmap.

The atlas, Latin America view, September 2026. 33 of its first 102 entries are in twelve Latin American countries.

102

verified initiatives at first release

47

countries

33

Latin American entries, 12 countries

300

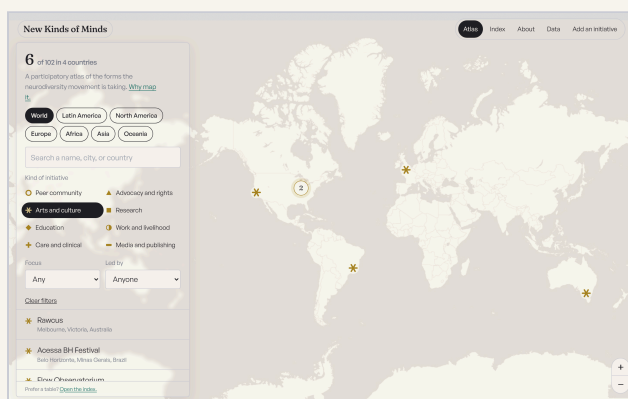

Latin American entries targeted by end of Phase I

The visual system

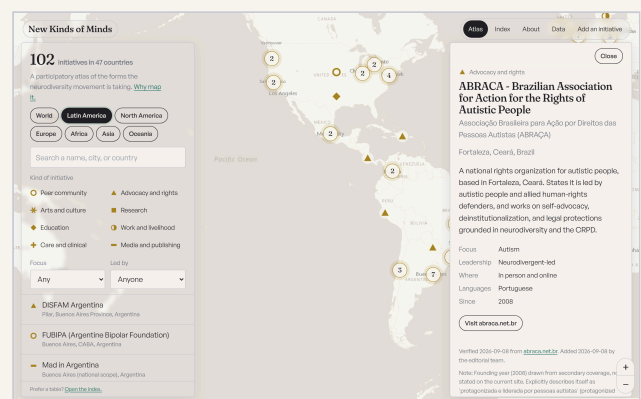

The map is drawn in one color of ink on paper-toned ground. What distinguishes initiatives is shape, not hue: each of the eight kinds has its own mark, so that a city or a continent can be read as a pattern of forms. The choice comes from the subject. A rainbow of pins would say "here are many things"; a field of marks says "here are kinds of things, and here is how they are distributed."

- Peer community
Networks run by and for neurodivergent people
- * Arts and culture
Collectives, studios, theatre, festivals
- ◆ Education
Schools, learning projects, training
- + Care and clinical
Therapeutic and health services

- ▲ Advocacy and rights
Political, legal, and policy work
- Research
Labs, centres, participatory inquiry
- ⓘ Work and livelihood
Employment, cooperatives, enterprise
- Media and publishing
Magazines, podcasts, archives

Filtered to arts and culture: five initiatives at first release, the smallest kind and the one Phase I most wants to grow.

An entry open. Gold becomes teal for the selected mark; the drawer shows source and verification date.

Typography is Fraunces for display and General Sans for text; the ground is a warm off-white with a faint grain; the only accent colors are gold for the marks and a deep teal for what is selected or interactive. The system was designed to hold in an exhibition, a research lab, and a public-interest technology conference at once.

Data architecture and provenance

A record is a row in a public file. The editable sources are JSON files in the repository, one per research pass; a build script validates every record against the schema and refuses to build the site if any record fails. The published copies (JSON and CSV) carry a version and a generation date. The git history is the provenance record until per-record history is built in Phase I.

id	kebab-case, stable, unique		
name	name as used internationally		
name_local	name in the initiative's own language, or null		
summary	one or two plain sentences, up to 320 characters		
type	advocacy community arts research education work care media		
focus	list: autism, adhd, dyslexia, dyspraxia, dyscalculia, tourette, ocd, bipolar, psychosis, intellectual-disability, down-syndrome, learning-disabilities, mad-pride, hearing-voices, neurodiversity-general		
leadership	nd-led mixed ally-led unknown (recorded only when the initiative states it)		
mode	physical online hybrid		
country	ISO 3166-1 alpha-2	country_name	English name
region	city or region	lat, lng	WGS84, city-level
languages	ISO 639-1 codes	url	official site
source_url	page the facts were verified against		
founded	year or null		
added	date the record entered the atlas		
verified	date it was last checked against its source		
added_by	editorial community		
notes	moderator notes shown on the entry page		

Rules that make it research-grade

- Every fact in a summary must be checkable at the source URL. Summaries are written in the atlas's own words; an organization's self-description is a source, not a caption.
- Leadership is never inferred. Unless the initiative says it is run by neurodivergent people, the value is `unknown`.
- A dead official site does not delete a record; the note says so, and the source points at a live third-party confirmation.
- Corrections change the source file through a reviewed submission or a pull request, so every change is attributable.

Planned in Phase I

`network` (federations and their members, drawn as links), `summary_i18n` (summaries by language), `status` (active, dormant, closed), `claimed_by` (verified contact from the initiative), per-record history, a read-only API, and a citable release with a DOI.

The participatory workflow

The atlas is designed to be written by the people on it. In the first release, contribution is a public form with human review. Phase I adds paid regional contributors, an advisory circle, record claiming, and participant-written testimonies. The workflow below is what a record goes through.

Who takes part in Phase I

Role	Who	What they do	Paid
Advisory circle	Six people from mapped Latin American initiatives: autistic-led, Mad Pride and antimanicomial, dyslexia and ADHD, research, arts	Two taxonomy sessions; inclusion criteria; consultation through the year	Honoraria
Regional contributors	One for Brazil, one for Spanish-speaking Latin America	Research and verify initiatives country by country; about six months part-time each	Fees
Initiatives mapped	Every Latin American entry	Claim and rewrite records; contribute testimonies; take part in gatherings	Fees for written contributions
Accessibility consultants	A neurodivergent-led consultancy	Review and guide implementation	Fees
Essayists	Two commissioned data-visual essays	Read the patterns the mapping reveals	Fees
Project lead	Daniel Rezinovsky	Method, editorial verification, development, coordination	Not funded by this grant

New Kinds of Minds

AtlasIndexAboutDataAdd an initiative

Add an initiative

The atlas grows by contribution. If you run, belong to, or know of an initiative that belongs here, describe it below. Entries are checked against their source before publication, and the person who submitted them is credited only if they ask to be.

Name of the initiative

Name in its own language, if different (optional)

What gets included

Organizations, communities, collectives, research groups, schools, festivals, media, cooperatives, and services whose work is about neurodivergent people, and which exist somewhere: a city, a region, or a clearly based online network.

Initiatives led by neurodivergent people are a priority, and family-led or professional-led ones are welcome. The atlas records which is which, without ranking them.

Not included: individual practitioners
advertising services, products, and projects

Latin America, Phase I

The first 33 Latin American entries show the range the year will work in: autistic-led collectives and national federations, family-led dyslexia and ADHD associations, the antimanicomial and Mad Pride traditions, a hospital radio, a hearing-voices group, a university research nucleus. Twelve of the 33 are recorded as neurodivergent-led, ten as family- or professional-led, six as mixed, five as unknown. Those proportions are one of the things Phase I will find out about properly.

Country	First entries (September 2026)
Brazil (15)	ABRAÇA (Fortaleza), Coletivo Autista USP, Coletivo Autista UFRGS, Movimento Orgulho Autista Brasil, Movimento Nacional da Luta Antimanicomial (Salvador), Mad in Brasil, Hearing Voices Network USP Ribeirão Preto, RIOSOC, ABDA, Associação Brasileira de Dislexia, Instituto ABCD, Introvertendo, Specialisterne Brasil, UFSC neurodivergent students project, ACESSA BH festival
Argentina (4)	Orgullo Loco Buenos Aires, Mad in Argentina, FUBIPA, DISFAM Argentina
Uruguay (3)	Radio Vilardevoz (Montevideo), Aletea, RUATDAH
Chile (3)	Orgullo Loco Chile, FUAN, Millennium Nucleus on Disability and Citizenship (DISCA)
Mexico (2)	Autistas de México, Colectivo Chuhcan
Colombia (2)	AUTISCOL, DISFAM Colombia
Peru, Paraguay, Costa Rica, Dominican Republic (1 each)	APEAU (Lima), ASO TEA Paraguay, BarrileTEA, Fundación Dominicana de Autismo

Where the year goes

- **Beyond capitals.** The first pass is capital-heavy. Contributors work state by state and province by province, with the advisory circle's networks as the starting lists.
- **Beyond the word.** Initiatives that never say neurodiversity: antimanicomial collectives, hearing-voices groups, Indigenous and Afro-descendant contexts where cognitive difference is described through kinship, spirit, or temperament. The atlas records their own terms.
- **Bolivia, Ecuador, Cuba, Central America.** Nothing verified yet; nothing is assumed to be absent.
- **Arts and media.** The smallest kinds at first release, and the ones a Latin American art foundation is best placed to help find.

Future visualizations

Once several hundred Latin American initiatives are on the map with leadership, focus, kind, language, and founding year, the atlas can draw things it cannot draw yet. Two of these will be commissioned as data-visual essays in Phase I; the others are the research program the dataset makes possible.

Leadership geography

A map in two inks: where initiatives are led by neurodivergent people and where by families and professionals, city by city. The question it asks is where the self-advocacy turn has happened and where it has not, and whether that follows language, wealth, or the local history of psychiatric reform.

Two vocabularies

Antimanicomial and neurodiversity initiatives drawn together, with their founding years. In Brazil the first tradition is older by twenty years; the essay asks where the two have met, where they ignore each other, and which words travel between them.

Institutional depth by focus

For each form of neurodivergence, how many kinds of initiative exist: autism has federations, collectives, media, research, and employment programs; Tourette or dyscalculia may have one association per country. A small-multiples chart of which minds have built institutions.

Absence map

The inverse of the atlas: regions and countries with nothing recorded, drawn as a question rather than a fact, and used to direct the next mapping pass.

Network view

Federations and their members as links (the Latin American autism networks, the Hearing Voices and Mad in America families, the Specialisterne foundations), drawn over the map so that a region's connective tissue becomes visible.

Time

Founding years as a slider: the movement appearing across the continent decade by decade.

Roadmap, January to December 2027

Month	Milestone	Strand
January	Advisory circle convened; regional contributors contracted	Taxonomy and advisory circle
February	Taxonomy 0.2 published with changelog; mapping begins	Taxonomy; mapping
April	100 Latin American entries; claiming campaign opens; Portuguese and Spanish interface live	Mapping; participation; platform
June	200 entries; accessibility review begins	Mapping; accessibility
July	300 entries; first data-visual essay	Mapping; artistic development
September	Accessibility implementation complete; second essay; network field live	Accessibility; artistic development
October	Dataset 1.0 with DOI and API; first gathering (Portuguese)	Publication; public program
November	Second (Spanish) and third (bilingual) gatherings	Public program
December	Documentation video and method account; evaluation; final report	Documentation and evaluation

Targets the year is measured against

- 300 verified Latin American entries in at least twelve countries; 500 worldwide.
- Six paid advisors, two paid contributors, 40 community submissions, 20 claimed records.
- Interface and summaries in three languages; core flows at WCAG 2.2 AA; public accessibility statement.
- Dataset 1.0 with API and DOI; two data-visual essays; three gatherings with at least 60 participants in total.

After the grant

The site is a static export served for free; the data is a public file; the submissions service costs twelve dollars a month on a shared server. Contributions continue, the dataset keeps its value with every correction, and the method is documented so that other regions can follow. Code is MIT; data is CC BY 4.0. Nothing about the atlas depends on its author to survive.
